

## Worksheet 6

Database Access, MySQL with “sakila” sample, PHP PDO

Program the following PHP pages, using “sakila” as the source database.

Q1: a page that displays country names in an HTML table.

Q2: a page that display the list of actors' names in alphabetical order, paginated at a rate of 10 actors per page, and put an index of page numbers at the bottom of the page to simplify browsing the list. Clicking on an actor name displays the list of his films on a new page (the actor's name is displayed in the header, then for each film his title, the category name and the duration of the film).
